

Flowroom

A shared workspace for designing and testing onboarding flows.

THE PROBLEM

Designers often switch between tools to create screens, collect feedback, and test a user journey. Flowroom brings these tasks into one workspace.

THE SOLUTION

The demo follows Bloom, a budgeting app, through three onboarding screens. Teams can edit the flow, leave comments, and try the experience before building the full product.

01 Welcome

Make a clear first impression

02 Profile setup

Collect a few useful details

03 Preferences

Let people choose their focus

KEY FEATURES

- Add, reorder, and edit screens on a visual canvas.
- Change text, colors, spacing, and button styles.
- Save shared edits and leave feedback on specific screens.
- Test mobile and desktop previews with form validation.
- Generate a starting point, review it, and apply it when ready.

DESIGN CHOICES

Navigation sits on the left, the journey stays visible in the center, and editing controls sit on the right. Reusable components keep screens consistent. Keyboard shortcuts, clear focus states, and reduced-motion support are included.

The central idea: Generation provides a starting point. Review, editing, and undo keep the designer in control.

CURRENT RESULT

A working local demo built with React, TypeScript, Tailwind CSS, Radix UI, and Cloudflare D1. Build, type, and API checks pass.

Generation currently uses templates; live AI needs an API key. Shared updates refresh every few seconds. Next: test with designers and improve the flow from their feedback.
